

The Auto-Archiver is used by MI Centres in the Middle East to make a back-up of their local database to a central database hosted by CoAcS.

Instructions for upgrading Existing Installations of MiDatabank Version 2 to use the Auto-Archiver:

Use this document for:

Upgrading

MiDatabank Version 2

to

MiDatabank Version 2 with Auto-Archiver

This document should only be used if MiDatabank version 2 is already installed:

Before upgrading it is important to make a note of the connection string to your database at the following locations:

```
C:\Program Files\CoAcS\MiDatabank 2\MIAdmin\Init.xml  
C:\Program Files\CoAcS\MiDatabank 2\MIEnquiryManager\Init.xml
```

Once the installation has completed it is necessary to enter the connection string to your database for both init.xml files in the following locations:

```
C:\Program Files\CoAcS\MiDatabank 2\MIAdmin\Init.xml  
C:\Program Files\CoAcS\MiDatabank 2\MIEnquiryManager\Init.xml
```

Alternatively, before upgrading you can make a copy of init.xml files, and once the installation has finished, paste these into the MiDatabank 2 directories. Note that both init.xml files will usually be identical.

Please note:

- This is a client upgrade only - there are no changes to the SQL database
- When upgrading a computer, users on other computers can continue to work with MiDatabank

To perform the upgrade:

The following three actions have to be completed on each PC using MiDatabank

(a) Uninstall the current version of the MiDatabank . This is done by going to Settings > Control Panel > Remove or Add Programs and then removing MiDatabank

Do NOT delete or alter your database which is located on your server

(b) Install the new version of MiDatabank by inserting the CDROM into each of the PCs that will be used by the MI centre staff, the installer should launch automatically.

(c) Re-configure the connection string as described above.
